## Generate Interpolation of F Function

| Velocity |  | Distance | Time | Acceleration | F Function |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 | 4 |
| 0 | 500 | $1.995 \cdot 10^{4}$ | 19.962 | 16.98 | 1.472.104 |
| 1 | 550 | $1.854 \cdot 10^{4}$ | 17.285 | 20.55 | 1.472.104 |
| 2 | 600 | $1.726 \cdot 10^{4}$ | 15.054 | 24.45 | ... |

## Determine Critical Ranges

$\mathbf{R}_{\text {Critical }}\left(\mathbf{V}_{\mathbf{0}}, \mathbf{V}_{\mathbf{F}}, \mathbf{n}, \mathbf{B C}\right):=\operatorname{root}\left[\mathbf{v}_{\mathbf{0}} \cdot\left(1-\frac{3 \cdot \mathbf{n} \frac{\mathbf{R}}{\mathbf{y d}}}{\frac{\mathbf{F 0}\left(\mathbf{v}_{\mathbf{0}}, \mathbf{B C}\right)}{\mathbf{f t}}}\right)^{\frac{1}{\mathbf{n}}}-\mathbf{V}_{\mathbf{F}}, \mathbf{R}, 0 \mathbf{y d}, 1000 \mathbf{y d}\right]$ from the standard projectile. This table is in all of my analysis work.

( ${ }^{\mathbf{T}}$ Pejsa model exponents. Because zero causes issues and would have to be handled as a special case, I will just assume a very small number, It will make no difference in my solution.

This is a simple root finder that works for this example - it will not work for every case. I could come up with a general solution, but this is sufficient for what I am doing in this example.

$\mathbf{R}_{\text {Breakpoint }}:=\left\lvert\,$| $\zeta \leftarrow\left(\begin{array}{l}0 \\ 0 \\ 0\end{array}\right)$ |
| :--- |
| for $\mathbf{i \in 0 . . 2}$ |
| for $\mathbf{j} \in 0 . . \mathbf{i}$ |
| $\zeta_{\mathbf{i}} \leftarrow \mathbf{R}_{\mathbf{1}_{\mathbf{j}}}+\zeta_{\mathbf{i}}$ |
| $\zeta$ |\(\quad\left(\begin{array}{c}727.5 <br>

855.2 <br>

1233.5\end{array}\right) \cdot\)| These are the ranges at which the |
| :--- |
| bullet's velocity transitions from |
| one velocity region to another. |\right.

$$
\mathbf{F}_{\mathbf{m}}\left(\mathbf{v}_{\mathbf{0}}, \mathbf{B C}, \mathbf{n}, \mathbf{R}\right):=\mathbf{F O}\left(\mathbf{v}_{\mathbf{0}}, \mathbf{B C}\right)-\left(0.75+0.00006 \cdot \frac{\mathbf{R}}{\mathbf{y d}}\right) \cdot \mathbf{n} \cdot \frac{\mathbf{R}}{\mathbf{y d}} \cdot \mathbf{f t}
$$

$\mathbf{D}\left(\mathbf{n}, \mathbf{v}_{\mathbf{0}}, \mathbf{B C}, \mathbf{R}\right):=|$| $\mathbf{F 1} \leftarrow \mathbf{F}_{\mathbf{m}}\left(\mathbf{v}_{\mathbf{0}}, \mathbf{B C}, \mathbf{n}, \mathbf{R}\right)$ |
| :--- |
| $\left[\frac{\frac{41.68}{\left(\frac{\mathbf{v}_{\mathbf{0}}}{\frac{\mathbf{t t}}{\mathbf{s}}}\right)}}{\left.\frac{1}{\frac{\mathbf{R}}{\mathbf{y d}}-\frac{1}{\frac{\mathbf{F 1}}{\mathbf{f t}}}}\right]^{2}} \mathbf{i n} \quad\right.$ in |

This is the formula Pejsa lists in his Appendix. He uses different formulas for Fm throughout the book.

- FO- 0.75. $\mathbf{n} \cdot \mathbf{R}$
- $\mathbf{F O}$ - $0.78 \cdot \mathbf{n} \cdot \mathbf{R}$
- $\mathbf{F O}=0.80 \cdot \mathbf{n} \cdot \mathbf{R}$
- $\mathbf{F O}-(0.75+0.00006 \mathbf{R}) \cdot \mathbf{n} \cdot \mathbf{R}$

I found this very irritating as I tried to duplicate his results.

$$
\mathbf{v}_{\mathbf{C}}:=\mathbf{v}_{\text {Critical }}\left[\mathbf{n 1},\left(\begin{array}{c}
\mathbf{v}_{\mathbf{0}} \\
\mathrm{CritVel}_{0} \\
\text { CritVel }_{1}
\end{array}\right), \mathbf{B C}, \mathbf{R}_{\mathbf{1}}\right]=\left(\begin{array}{c}
0.649 \\
0.265 \\
1.267
\end{array}\right) \cdot \frac{\mathbf{n}}{\mathbf{y n}} \begin{aligned}
& \text { These are the downward velocities of the } \\
& \text { projectile at the end of each of the critical } \\
& \text { velocity regions. }
\end{aligned}
$$
